

Virus is living and it's treatment

Kunal Joon

St Thomas School, India.

Abstract

A viral test is done to find infection causing viruses. Viruses grow only in living cells. Viruses causes disease by destroying or damaging the cells they infect, damaging the body's immune system Changing the genetic material (DNA) of the cells they infect or causing inflammation that can damage an organ. Viruses cause many types of diseases, such as human immunodeficiency virus (HIV), cold sores, chicken pox, measles, flu and some types of cancer.

Biography:

Kunal Joon is working it on from five years and classified virus into living organisms and discovered it's

treatment, Studied virology and oncology studied their DNA and RNA.
